CAUTION: PRELIMINARY RESULTS

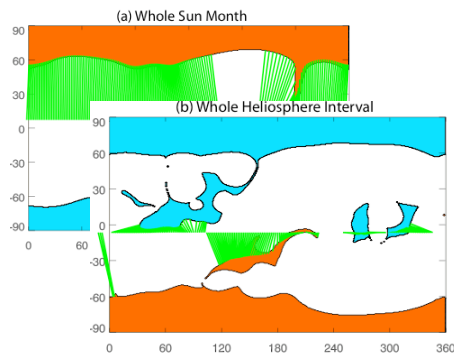

This talk explores the Whole Heliosphere Interval from the perspective of a global MHD model

Improved MHD modeling allows us to investigate physical processes producing observed coronal and heliospheric structure.

Preliminary calculations for CR2068 show promising matches with observations, but also some disagreements.

Comparison with Whole Sun Month (WSM) shows that structure of WHI is markedly different, in spite of the 11.5 year separation

Our improved global MHD code, MAS, includes energy transport processes.

$$\nabla \times \mathbf{B} = \frac{4\pi}{c} \mathbf{J}$$

$$\nabla \times \mathbf{E} = -\frac{1}{c} \frac{\partial \mathbf{B}}{\partial t}$$

$$\mathbf{E} + \frac{1}{c} \mathbf{v} \times \mathbf{B} = \eta \mathbf{J}$$

$$\frac{\partial \rho}{\partial t} + \nabla \cdot (\rho \mathbf{v}) = 0$$

$$\rho \left(\frac{\partial \mathbf{v}}{\partial t} + \mathbf{v} \cdot \nabla \mathbf{v} \right) = \frac{1}{c} \mathbf{J} \times \mathbf{B} - \nabla p - \nabla p_w + \rho \mathbf{g} + \nabla \cdot (\nu \rho \nabla \mathbf{v})$$

$$\frac{\partial p}{\partial t} + \nabla \cdot (p \mathbf{v}) = (\gamma - 1) \left(-p \nabla \cdot \mathbf{v} - \nabla \cdot \mathbf{q} - n_e n_p Q(T) + H \right)$$

$$\gamma = 5/3$$

$$\mathbf{q} = -\kappa_{\parallel} \hat{\mathbf{b}} \hat{\mathbf{b}} \cdot \nabla T \quad (\text{Close to the Sun, } r \lesssim 10R_s)$$

$$\mathbf{q} = 2\alpha n_e T \hat{\mathbf{b}} \hat{\mathbf{b}} \cdot \mathbf{v} / (\gamma - 1) \quad (\text{Far from the Sun, } r \gtrsim 10R_s)$$

The Dog

Coronal Hole Boundaries

The Current Sheet

Did I mention that these are preliminary results?

CR 1913

CR 2068

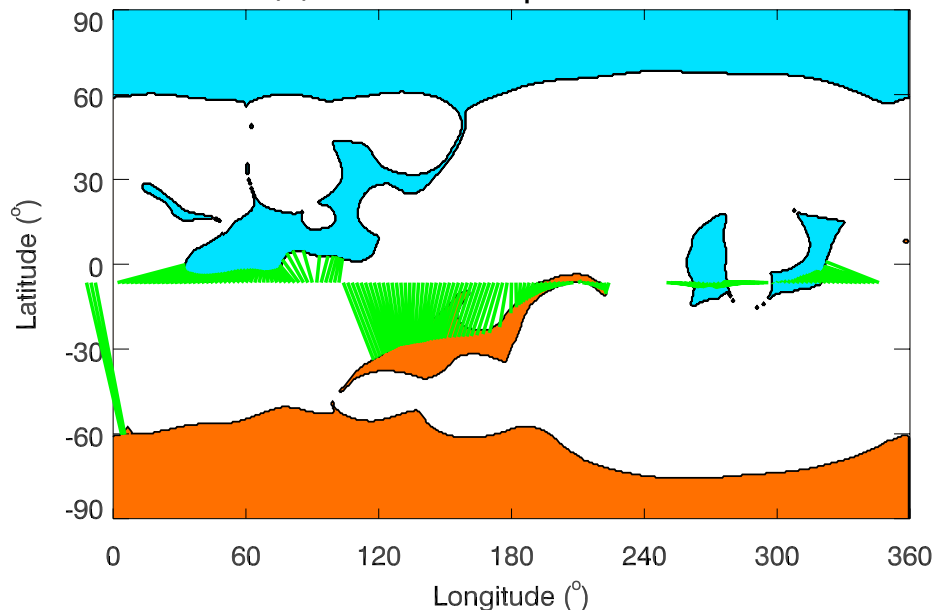

Are they serving beer yet?

Important differences exist between old polytropic solutions and new thermodynamic solutions.

(a) Whole Sun Month

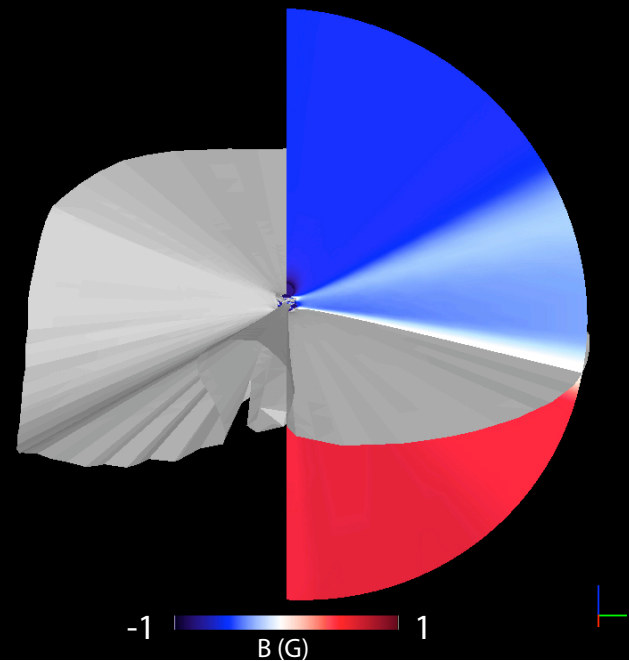

(b) Whole Heliosphere Interval

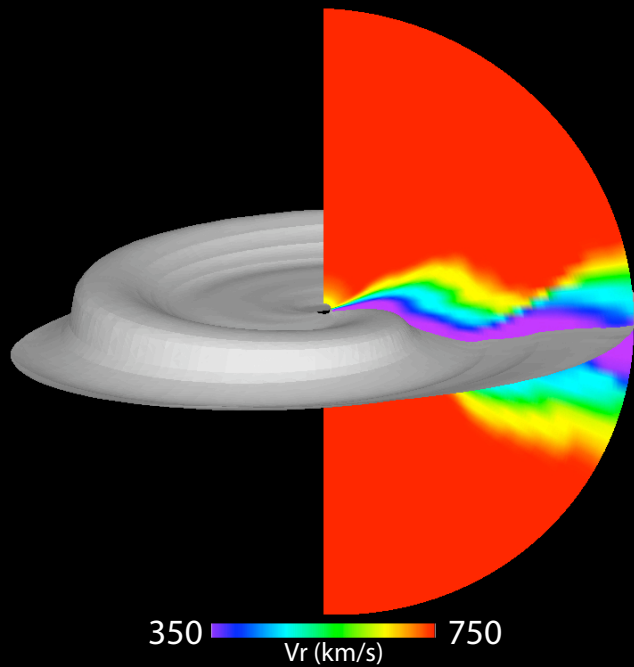

(a) Whole Sun Month: Corona

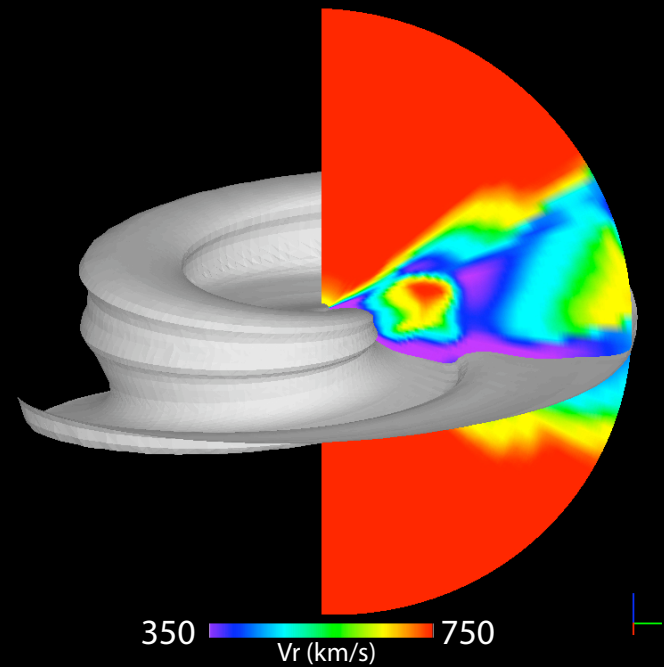

(b) Whole Heliosphere Interval: Corona

(c) Whole Sun Month: Heliosphere

(d) Whole Heliosphere Interval: Heliosphere

Summary

▪The improved thermodynamic model will allow us to investigate coronal and heliospheric structure in more detail:

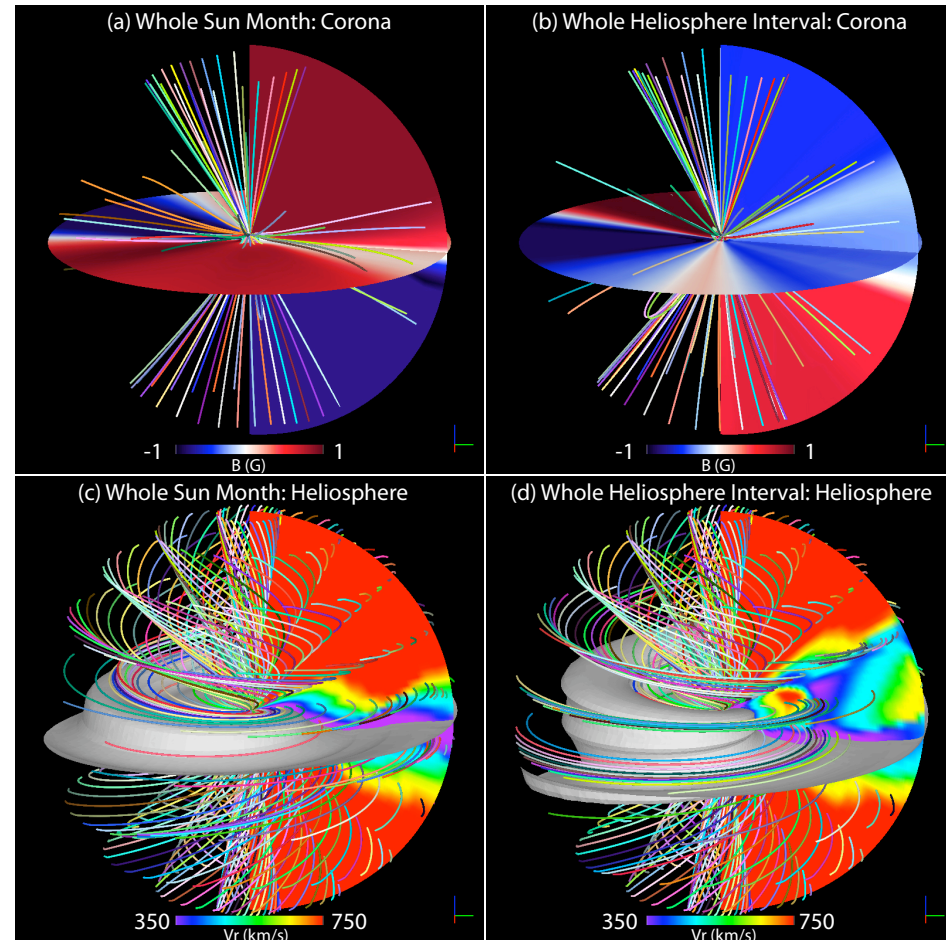

- Quantitative emission comparisons
- Direct comparisons with in situ measurements
- Address topics such as the source of the solar wind

▪Comparison of WHI with WSM:

- Two intervals have markedly different structure given 11.5-year separation
- Will allow us to explore the characteristics of polar and equatorial sources of solar wind

▪Results on the web:

- Polytropic solutions are currently available at: <http://iMHD.net/stereo>
- Thermodynamic solutions will be made available at the same location when validated
